

Integration with European gas transmission system

GAZ-SYSTEM S.A. is actively participating in creation of an integrated gas pipeline network in Central Europe, thus contributing to the development of the European gas sector.

Our vision of development of the transmission infrastructure in Poland becomes an integral part of the European Union's strategy to increase energy security and enable the diversification of natural gas supplies.

The development of the gas transmission networks in Poland may constitute an important element of the [North - South Gas Corridor](#) connecting the LNG terminal in [winouj cie](#) with the planned LNG terminal in Croatia and Southern Gas Corridor project by intermediary of the transmission infrastructure of Central European countries.
