

Environmental Protection Management

Environmental Management System is applied with respect to:

- transmission of natural gas all over the country.

Environmental goals of GAZ-SYSTEM include:

- enhancement of efficient management of the natural environment,
- continuous improvement of the processes affecting the natural environment (e.g. those related to investments, repairs, maintenance, purchases),
- minimization of the negative impact exerted upon the environment, to name in particular:
 - waste management,
 - water and sewage management,
 - emission of air pollution,
 - emission of noise,
- protection of some species of fauna and flora,
- rational use of media and resources,
- full compliance with applicable regulations,
- increase ecological awareness among the employees.

These goals are performed through:

- using the best available techniques to reach high level of protection of the natural environment as a whole,
- limiting wastes,
- monitoring water, air and soil contamination and ensuring compliance with acceptable emission standards,
- restricting and keeping noise emission at the acceptable level within the best reachable technologies,
- providing continuous compliance with the binding environmental protection laws and identifying permanently and tailoring the operations to new legal requirements,
- attracting the employees to get involved into environmental initiatives, organizing trainings and ensuring an efficient flow of information relating to environmental commitments,
- restoring natural elements.
